Re: **Robinson and Tooley Creek Flood Mitigation Study**

TECHNICAL MEMORANDUM

1 INTRODUCTION

T.Y. Lin International Canada Inc. (TYLin) was retained by Central Lake Ontario Conservation Authority (CLOCA) to complete the Robinson and Tooley Creek Flood Mitigation Study in the Municipality of Clarington (the Municipality).

The recently completed Robinson and Tooley Creek Subwatershed Study, Phase 2 and 3 (SWS) (ABL, 2022) predicted that future development in the Tooley Creek watershed will result in increased peak flow rates in Tooley Creek during the Regulatory Storm. This Flood Mitigation Study is an additional assessment of flood mitigation measures beyond the SWS to identify approaches to provide Regulatory flood protection along Tooley Creek.

The SWS had previously recommended Regional Storm control SWM facilities as flood control measures within future development areas. Sizing SWM facilities for Regional Storm control usually results in larger footprints relative to facilities designed for standard 100-year peak flow control, which will reduce the remaining development areas and increase the Municipality's long-term maintenance costs. Potential flood mitigation alternatives to reduce Regulatory flood levels may offer greater benefits to a broader range of stakeholders relative to Regional Storm control ponds.

Prior to developing additional flood mitigation alternatives, this study included refinements to the hydraulic modelling that is currently used by CLOCA for the Regulatory floodplain mapping for Robinson and Tooley Creeks. The refinements included spill analyses to delineate a more accurate Regulatory floodplain, with CLOCA's current Regulatory peak flow rates, to be used as the basis for assessing impacts and flood mitigation alternatives. Hydrologic modelling updates for future land uses were also completed to determine new Regulatory peak flow rates due to proposed development.

This technical memorandum summarizes the hydrologic and hydraulic modelling refinements (**Sections 2 and 3**), the potential flood mitigation options (including Regional Storm control

SWM facilities recommended in the SWS) (**Section 4**), an evaluation of the mitigation options (**Section 5**), and modelling analysis of the preferred option with ultimate development within the watersheds (**Section 6**).

2 HYDROLOGIC MODELLING UPDATE

The hydrologic peak flow rates used in this study were based on CLOCA's Visual OTTHYMO (VO) hydrologic modelling for Robinson Creek and Tooley Creek, which is currently used to establish the Regulatory floodplains in both watersheds. The current flood modelling package for Robinson Creek was completed by CLOCA in February 2010 (revised March 31, 2010) (CLOCA, 2010), while the Tooley Creek flood modelling package was completed in October 2007 (revised March 2008 and March 2012) (CLOCA, 2012). The current floodplain mapping for these watersheds was based on the future conditions Regulatory flow rates from the above models. For this study, the VO models for each watershed were updated to reflect future conditions land use from three Secondary Plan areas (Southeast Courtice, Southwest Courtice, and Courtice Waterfront and Energy Park) and the Official Plan (OP) for the Courtice Employment Lands (**Attachment A**) to assess the impact of proposed development on the floodplain.

The hydrologic modelling update was limited to the future conditions Regulatory (uncontrolled) scenario, which does not consider quantity controls from SWM Ponds within the watersheds. This approach is consistent with provincial guidelines, documented in the Technical Guide, River and Stream Systems; Flooding Hazard Limit (MNR, 2002). Design storms were limited to the 100-year 12-hour Chicago distribution and the Regional Storm (Hurricane Hazel). Peak flow rates from both design storms were used in the hydraulic model, where the outer most floodline generated from the above design storm peak flow rates is used as the Regulatory floodline. The design storms were consistent with previous hydrologic modelling for these watersheds.

A future conditions GIS land use layer and hydrologic modelling parameters were provided by CLOCA for this analysis. The main land use categories for the hydrologic model are presented on **Figure 2a, Attachment D**, while land use subcategories found in Secondary Plans and the OP are shown on **Figure 2b, Attachment D**. The models' land use update was completed by determining the area associated with each land use for each subcatchment area using GIS tools. The land areas were incorporated into the hydrologic parameter spreadsheets provided by CLOCA as part of the modelling packages to calculate the imperviousness, initial abstraction and CN values. Subwatershed boundaries, channel routing parameters, flow nodes, and hydrologic modelling parameters unrelated to land use were unchanged from previous modelling.

Results from the hydrologic modelling update indicated that 100-year and Regional Storm peak flow rates slightly decreased in the Robinson Creek watershed for most flow nodes (relative to

the 2010 future conditions model) due to the land use update, except for minor increases in the Robinson West Tributary (**Table 2-1**). This result is because the land use update included more greenspaces and natural heritage area, which increased the total pervious area in the watershed compared to the 2010 future conditions model, thus decreasing peak flow rates.

In Tooley Creek, the updated future conditions land use generated 100-year and Regional Storm peak flows that were greater than the 2012 future conditions modelling (**Table 2-2**) due to the increase in proposed development (impervious) area. Additional modelling results are provided **Attachment B** and flow node locations are shown on **Figure 1, Attachment D**.

TYLin

Table 2-1 Robinson Creek Peak Flow Rates

| Reach | NHYD | 2010 CLOCA Future Conditions | | 2023 TYLin Future Conditions Update Peak | |
|---|---------|------------------------------|----------|--|----------|
| | | 100-year | Regional | 100-year | Regional |
| Robinson Creek upstream of West Tributary HEC-RAS Reach: RobinsonUpper | 349 MJR | 2.02 | 0.72 | 2.02 (Note 1) | 0.86 |
| | 351 | 7.05 | 1.21 | 7.71 | 1.82 |

| | 27 | 16.67 | 20.80 | 35.85 | 21.46 |

1. Peak flow rates were calculated by dividing hydrologic subcatchment flow rates according to flow node locations within select subcatchments. This methodology was carried over from the Tooley Creek hydrologic modelling completed in 2012 (CLOCA, 2012).
2. The 2012 hydrologic modelling included a computational error that incorrectly reported flow rates for RS 3700, 3300 and 2800, which was corrected in this study and hydraulic model input.

3 HYDRAULIC MODELLING UPDATE

3.1 Hydraulic Modelling Methodology

The hydraulic modelling updates to the Robinson and Tooley Creek floodplain modelling were completed to incorporate spill analyses that were either not completed, or partially completed under the current floodplain modelling packages for each respective watershed. From previous modelling, three spill areas were identified:

- ▶ From the main branch of Robinson Creek to the West Tributary of Tooley Creek along the ditch north of and parallel to Highway 401 (referred to herein as the 'Robinson Creek Spill')
- ▶ From the main branch of Tooley Creek through the Courtice Road underpass at Highway 401 (referred to herein as the 'Courtice Road Underpass Spill')
- ▶ From the main branch of Tooley Creek to the West Tributary of Tooley Creek along the ditch north of and parallel to Highway 401 (referred to herein as the 'Tooley Creek Main Branch Spill').

Similar to the hydrologic modelling update, the hydraulic modelling updates built upon the HEC-RAS models for Robinson Creek (CLOCA, 2010) and Tooley Creek (CLOCA, 2012) provided in the floodplain modelling packages. Modifications to the model geometry are summarized as follows:

- ▶ The Digital Elevation Model (DEM) for the area around the Courtice Road and Highway 401 interchange was updated with a recent DEM compiled by CLOCA that reflect the recent works by the Ministry of Transportation (MTO). Additional information used to update the geometry include a topographic survey provided by CLOCA (dated November 2, 2022) for the ditch along the north side of the Highway 401 and select culverts, as well as drawings provided by MTO for the Highway 401 profile and culvert crossings. The height of the Highway 401 concrete median was also included at a height of 1.05 m above the road deck elevation as per the Highway 401 design drawings.
- ▶ Due to the spill from Robinson Creek to Tooley Creek, the hydraulic models from the two watersheds were combined into a single HEC-RAS model.
- ▶ The West Tributary of Tooley Creek was extended north of Highway 401 with the culvert crossing and Highway 401 road deck (including concrete median). North of Highway 401, the west tributary was divided into two reaches extending east and west along the ditch parallel to the north side of Highway 401, which receive flows from the Robinson Creek Spill and the Tooley Creek Main Branch Spill.

- ▶ The Robinson Creek Spill and Tooley Creek Main Branch Spill were modelled with lateral structures that used the cross-section geometry at the spill crests as weirs. Flows that overtop the lateral structure weirs were carried downstream into branches of the Tooley Creek West Tributary that follow the ditch along the north side of Highway 401.
- ▶ The Tooley Creek main branch cross-section geometry upstream and downstream of Highway 401 was reconfigured to model the Courtice Road underpass at Highway 401 as a hydraulic opening in the Highway 401 crossing. This required cross-sections to be reconfigured such that the road decks at Highway 401 and Darlington Park Road are perpendicular to the direction of flow.

To assess the impact of proposed development on the Regulatory floodplain, hydraulic modelling was completed using the updated geometry with peak flow rates outlined in **Section 2**, including flows from CLOCA (2010/2012) and flows updated through this study. A summary of the HEC-RAS plans used in this analysis is provided in **Table 3-1** below. Flow rates for each HEC-RAS plan and output tables are provided in **Attachment C**. The resulting preliminary floodplain was plotted on **Figure 3, Attachment D**.

For Robinson Creek, the spill analysis (described in **Section 3.2**) indicated a spill towards the West Tributary of Tooley Creek. To be conservative, the peak flow rates used in plans *ExReg* and *PropReg* had included the Robinson Creek Spill flow rate (lost to the west tributary of Tooley Creek) within the main branch of Robinson Creek downstream of the spill area.

The Robinson Creek Spill flow rate ($15.27 \text{ m}^3/\text{s}$ or $3.38 \text{ m}^3/\text{s}$, **Table 3-3**) was added to the flow rate within the main branch of Robinson Creek at River Station 772 (from NHYD 322, **Table 2-1**), downstream of Darlington Park Road, which was selected because the location is far enough downstream to not impact the tailwater condition for the Robinson Creek Spill upstream of Highway 401. Note that the Tooley Creek Main Branch Spill was a small flow rate that was considered negligible compared to peak flow rates downstream of the spill and hence the spill flow was not added back into the main branch of Tooley Creek downstream of the spill.

Additionally, the Robinson Creek hydraulic model completed by CLOCA in 2010 included a storage analysis upstream of the CPR to determine the upstream water elevations. This storage analysis is sensitive to tailwater condition downstream of the CPR, which in turn was influenced by the Robinson Creek Spill.

Therefore, the updated Robinson Creek Spill also required an update to the storage analysis upstream of CPR to account for the change in peak flow rates. The methodology outlined by in the Robinson Creek Floodplain modelling package (CLOCA, 2010) was generally replicated with the HEC-RAS hydraulic model and VO hydrologic model for storage volume analysis.

TYLin

Table 3-1 Summary of HEC-RAS Model Plans

| Plan Title / File | Geometry Title / File | Flow Title / File |
|---|--|--|
| ExReg_spill <i>TooleyRobinson.p06</i> To determine spill flow rates under current Regulatory flow rates. | Tooley_Robinson_2023 <i>TooleyRobinson.g04</i> CLOCA's 2010/2012 model geometry updated by TYLin for spill analysis and Courtice Road / Highway 401 interchange improvements. | ExReg_flows_spill <i>TooleyRobinson.f04</i> CLOCA 2010/2012 flow rates. |
| PropReg_spill <i>TooleyRobinson.p08</i> To determine spill flow rates under proposed Regulatory flow rates. | Tooley_Robinson_2023 <i>TooleyRobinson.g04</i> See above | PropReg_flows_spill <i>TooleyRobinson.f03</i> Flow rates updated by TYLin with new future land use data. |
| ExReg <i>TooleyRobinson.p07</i> To plot Regulatory floodline under the current Regulatory flow rates. | Tooley_Robinson_2023 <i>TooleyRobinson.g04</i> See above | ExReg_flows <i>TooleyRobinson.f08</i> CLOCA 2010/2012 flow rates, with spill flows lost from system added back to downstream reaches. |
| PropReg <i>TooleyRobinson.p10</i> To plot Regulatory floodline under TYLin updated future conditions flow rates. This plan to be carried into future floodplain mapping and modelling package. | Tooley_Robinson_2023 <i>TooleyRobinson.g04</i> See above | PropReg_flows <i>TooleyRobinson.f09</i> Flow rates updated by TYLin with new future land use data, and spill flows lost from system added back to downstream reaches. |
| CPR_wse <i>TooleyRobinson.p11</i> Robinson without a set WSE upstream of CPR to determine stage-discharge rating curve at CPR. | Tooley_Robinson_2023 <i>TooleyRobinson.g04</i> See above | PropReg_flows_CPR <i>TooleyRobinson.f10</i> Same as <i>PropReg_flows</i> without a set WSE upstream of CPR at Robinson Creek and additional profiles to develop stage-discharge rating curve. |

In TYLin's update, the stage-storage relationship upstream of the CPR established in the analysis completed by CLOCA in 2010 was used because the topography for the reach was expected to have remained the same as the previous analysis. A stage-discharge rating curve for the CPR was obtained from the HEC-RAS model (plan: *CPR_wse*) to form a stage-discharge-storage relationship.

The tailwater elevation downstream of the CPR (with spill analysis) was also modelled with HEC-RAS plan: *CPR_wse*. The discharge-storage rating curve was inputted into VO to model the storage volumes upstream of the CPR for the 100-year and Regional Storm events, which in turn, were used to determine the water surface elevation upstream of the CPR using the stage-storage curve. The storage used, as reported from the VO model, was applied to the stage-storage curve above the tailwater elevation, consistent with the method described in the floodplain modelling package (CLOCA 2010), recognizing that this is a conservative approach. The resulting water surface elevation was inserted into the HEC-RAS model for Robinson Creek immediately upstream of the CPR (**Table 3-2**).

Table 3-2 Summary of Robinson Creek Storage Upstream of CPR

| Study | Scenario | Water Surface Elevation (m) |
|---|-------------------------------------|-----------------------------|
| CLOCA 2010 | Regional – Without Storage Analysis | 99.55 |
| | Regional – With Storage Analysis | 96.28 |
| | 100-year – Without Storage Analysis | 99.58 |
| | 100-year – With Storage Analysis | 96.19 |
| TYLin Robinson-Tooley Flood Mitigation | Regional – Without Storage Analysis | 99.69 |
| | Regional – With Storage Analysis | 94.78 |
| | 100-year – Without Storage Analysis | 99.78 |
| | 100-year – With Storage Analysis | 95.88 |

3.2 Hydraulic Modelling Results

The hydraulic modelling at the spills predicted that flows from both the Robinson and Tooley Creek main branches spill towards the Tooley Creek West Tributary located between the main branches of each creek (**Table 3-3**). The low point in Highway 401 within these watersheds is also located near the Tooley Creek West Tributary culvert crossing of Highway 401, and thus the

model also predicted flows overtopping Highway 401 at that location.

Flows also spill through the Courtice Road underpass, as noted in current floodplain mapping, but was not previously modelled. Also note that the TYLin updated flow rates had a decrease in Robinson Creek flows and an increase in Tooley Creek flows compared to CLOCA's 2012 future conditions flows, which had a corresponding impact on the flow rates at each spill area. Floodplain mapping downstream of the spill areas was based on full flows in both the Robinson and Tooley Creek main branches (i.e., conservatively includes the flows that are removed from the reaches due to the spills).

Table 3-3 Summary of Spill Analyses Results

| Spill Area | Peak Flow Rate through Spill | | Notes |
|--|--|--|---|
| | CLOCA Flows | TYLin Updated Flows | |
| Robinson Creek Spill to Highway 401 Ditch (ultimately to Tooley West Tributary) | 100-year: 15.27 m ³ /s Regional: no spill | 100-year: 3.38 m ³ /s Regional: no spill | Previous spill analysis completed by CLOCA in 2010 indicated a spill flow rate of 19.10 m ³ /s. TYLin updated 100-year flows were about 14 m ³ /s less than CLOCA 2010 flows, hence the difference between flow rate scenarios. |
| Courtice Road Underpass Spill under Highway 401 (to main branch of Tooley Creek) | 100-year: none Regional: 24.17 m ³ /s | 100-year: 39.85 m ³ /s Regional: 37.62 m ³ /s | Not modelled in 2012 CLOCA hydraulic model. TYLin updated total flows in Tooley Creek were greater than CLOCA 2012 flows by about 60 m ³ /s for the 100-year storm and about 13 m ³ /s for the Regional storm, hence the difference between flow rate scenarios. |
| Tooley Creek Main Branch Spill Highway 401 Ditch (ultimately to Tooley West Tributary) | No spill for 100-year or Regional | 100-year: 0.32 m ³ /s Regional: 0.13 m ³ /s | |

Select water surface elevations for Robinson Creek are presented in **Table 3-4** with the updated hydraulic modelling. In general, no change or minor decreases in flood levels were noted.

The predicted water surface elevations for select areas in the Tooley Creek watershed are summarized in **Table 3-5**. Tooley Creek was divided into reaches based on the hydraulic modelling results, for the purposes of developing flood mitigation options (described in

TYLin

Section 4). The water surface elevations were generated from model scenarios using the CLOCA flows and TYLin flows and rounded to the nearest 0.1 m according to CLOCA's standard practice. HEC-RAS output tables for both Robinson and Tooley Creek are included in **Attachment C**.

In general, increases in water surface elevations due to the increase in flow were predicted for all reaches of Tooley Creek, where reaches upstream of the CPR and downstream of the CNR had increases in flood elevations of up to 0.2 m. The most impacted area is located between Highway 401 and the CPR, which had flood elevation increases of up to 0.9 m (Reaches 3 and 4). The corresponding impacts to floodplain area are shown on **Figure 3, Attachment D**.

Table 3-4 Summary of Regulatory Water Surface Elevations in Robinson Creek

4 MITIGATION OPTIONS

4.1 Overview

A discussion of the floodplain areas impacted by future development and potential flood mitigation options are described below. These options build upon the flood control considerations from the SWS. Note that flood mitigation options are not proposed for Robinson Creek because the updated hydraulic modelling for Robinson Creek predicted no change or minor decreases in flood levels across the floodplain model.

For each mitigation option, a brief discussion is provided of the feasibility, effectiveness, implementation, approvals and cost considerations.

4.2 Tooley Creek Flood Mitigation Options

4.2.1 Main Branch Reach 1 (Upstream of Bloor Street)

The increase in Regulatory water surface elevation (up to 0.2m) and floodplain extent upstream of Bloor Street is relatively minor and do not appear to be impacted by the Bloor Street crossing. The specific flood mitigation options for this reach are as follows:

► **Option 1a – Regional control SWM facilities for all new development**

All new development areas contributing to Tooley Creek are to have Regional Storm control to match peak flows in existing conditions. The SWS outlined twelve (12) municipal dry ponds located within the Tooley Creek watershed under the Southeast Courtice Secondary Plan and within the Courtice Employment Lands. A unit storage of 450 m³/ha was selected by the SWS based on hydrologic modelling to reduce post-development flows below pre-development flows. A list of SWM facilities within the Tooley Creek watershed proposed by the SWS is found in **Table 4-1**.

Table 4-1 Proposed Municipal SWM Facilities within Tooley Creek Watershed

| Secondary Plan | SWM Facility Name (from SWS) | Drainage Area (ha) | Storage Volume (m ³) |
|----------------------------------|---------------------------------|--------------------|-------------------------------------|
| Courtice Employment Lands | CEL-P1 | 54.9 | 24,706 |
| | CEL-P2 | 30.3 | 13,626 |
| | CEL-P3 | 48.0 | 21,587 |
| | CEL-P4 | 32.2 | 14,491 |
| Southeast Courtice | SEC-P1 | 31.9 | 14,355 |
| | SEC-P2 | 9.2 | 4,144 |
| | SEC-P3 | 26.6 | 11,951 |
| | SEC-P4 | 31.7 | 14,250 |
| | SEC-P5 | 10.9 | 4,927 |
| | SEC-P6 | 10.9 | 7,931 |
| | SEC-P7 | 21.7 | 9,770 |
| | SEC-P10 | 19.3 | 8,668 |

1. Data from Table 7.1 of the Robinson Creek & Tooley Creek SWS, Phase 2 and 3 report (ABL, 2022).

The Regional Storm control SWM facilities would be implemented as development occurs and will be sized according to criteria outlined in the SWS. To be considered for Regulatory storm control, the SWM facilities must be designed according to the Lakes and Rivers Improvement Act (LIRA) standards for small dams (ABL, 2022).

This option has large cost considerations when considering the additional land requirements taking away from development potential, and additional costs for the Municipality to maintain and reconstruct the facilities at the end-of-life cycle.

► **Option 1b – Landowner consent for minor increase in flood levels**

This area is future urban development under the Southeast Courtice Secondary Plan. The minor increase in flood levels and floodplain area will remain contained within the limits of natural features associated with the Tooley Creek Valley. The impact to development from the local increase in floodplain area would be less than the impact to development if Regional Storm control SWM facilities were implemented and is therefore likely to achieve a net increase in developable area. Given that increase in flood extent will not impact any structures, this option will have a negligible impact on the short-term utility of the land for agriculture and will not reduce developable area, the solution would likely be considered acceptable to the affected landowners.

4.2.2 Main Branch Reach 2 (Bloor Street to CPR)

The increase in Regulatory water surface elevation (up to 0.1m) and floodplain extent is relatively minor between Bloor Street and the CPR. The specific flood mitigation options for this reach are as follows:

- ▶ **Option 2a – Regional control SWM facilities for all new development**

Refer to description under Option 1a.

- ▶ **Option 2b – Regional control SWM facilities in select areas of new development**

This option considers only providing Regional Storm control for the upstream residential/mixed use developments within the Southeast Courtice Secondary Plan, and not providing Regional Storm control for the Courtice Employment Lands located further downstream in the Tooley Creek watershed.

Quantity controls in the upstream areas of the watershed will sufficiently delay peak flow rates in Tooley Creek such that overall runoff peaks further downstream in the watershed will be equal to (or marginally greater than) existing Regulatory flows. Since the Courtice Employment Lands are located further downstream in the watershed than the Southeast Courtice Secondary Plan area, the four Regional control SWM facilities proposed for those areas would be excluded in this option.

A cursory review of this option was completed using the SWS hydrologic model as a proxy for assessing the effectiveness of this option (**Table 4-2**). Note that the peak flow rates within Main Branch Reaches 3 and 4 are less than the existing Regulatory flow rates (Regional Storm) in this option. More detailed hydrologic modelling would need to be completed to confirm the effectiveness of this option.

The results indicate that peak flow rates in Tooley Creek will be sufficiently mitigated for the Main Branch Reaches 1 to 4, which includes the area upstream of Highway 401 with the greatest flood elevation and extent increase in future conditions. This option will not provide mitigation for the West Tributary of Tooley Creek and the downstream-most reach of the main branch of Tooley Creek. Mitigation measures for these areas are discussed in **Sections 4.2.6 to 4.2.8**.

Table 4-2 Review of Subwatershed Study SWM Facilities for Flood Mitigation in Tooley Creek

| Flood Mitigation Reach | NHYD (Note 1) | Existing 2018 (m ³ /s) (Note 1) | Future Uncontrolled (m ³ /s) (Note 1) | Future (Traditional) at 450 m ³ /ha (m ³ /s) (Note 1) | Future (Traditional) at 450 m ³ /ha Without SWM Facilities CEL-P1 to CEL-P4 (m ³ /s) |
|--|------------------|---|---|---|--|
| 100-year | | | | | |
| Reach 1 (upstream of Bloor Street) | 3 | 22.33 | 26.08 | 11.14 | 10.87 |
| Reach 2 (Bloor Street to CPR) | 7 | 39.53 | 50.69 | 27.20 | 25.98 |
| Reach 3 (CPR to Baseline Road) | 17 | 46.59 | 66.93 | 32.48 | 44.06 |
| Reach 4 (Baseline Road to Hwy 401) | 18 | 46.95 | 76.19 | 32.97 | 49.25 |
| | 19 | 62.19 | 96.78 | 52.04 | 77.71 |
| Reach 5 (Hwy 401 to Darlington Park Road) | 20 | 69.30 | 109.62 | 67.58 | 95.38 |
| West Tributary Reach 2 (Confluence to Hwy 401) | 27 | 26.35 | 40.91 | 22.58 | 44.51 |

| | 35 | 92.30 | 122.24 | 81.98 | 112.24 |
| Regional | | | | | |
| Reach 1 (upstream of Bloor Street) | 3 | 25.85 | 25.75 | 19.68 | 19.68 |
| Reach 2 (Bloor Street to CPR) | 7 | 62.37 | 62.03 | 51.10 | 52.11 |
| Reach 3 (CPR to Baseline Road) | 17 | 76.72 | 77.24 | 62.28 | 64.86 |
| Reach 4 (Baseline Road to Hwy 401) | 18 | 77.35 | 78.38 | 62.84 | 65.43 |
| | 19 | 94.01 | 97.15 | 77.62 | 82.22 |
| Reach 5 (Hwy 401 to Darlington Park Road) | 20 | 102.07 | 106.93 | 85.72 | 91.99 |
| West Tributary Reach 2 (Confluence to Hwy 401) | 27 | 19.72 | 19.80 | 15.26 | 19.85 |
| Reach 6 (Darlington Park Road to Lake Ontario) | 29 | 119.60 | 124.48 | 98.68 | 109.43 |
| | 35 | 128.68 | 133.29 | 107.74 | 118.80 |

1. Based on Tables 6.1 and 6.2 of the Robinson Creek & Tooley Creek SWS, Phase 2 and 3 report (ABL, 2022).
2. **Bolded** peak flow rate denotes Regulatory peak flow rate for each scenario.

► **Option 2c – Landowner consent for minor increase in flood levels**

Structural solutions to mitigate flooding through this reach were initially explored.

However, the backwater from the CPR embankment only extends a short distance upstream, and modifications to the CPR crossing would not fully mitigate the predicted increases in flood levels through the majority of this reach.

There are five (5) impacted landowners within this reach. Increases in Regulatory water surface elevations are relatively minor (0.1m or less) throughout the reach, and in most areas the associated increase in flood extent is imperceptible. Where there is a visible increase in flood extent, the increase is comparable to the thickness of the flood line as plotted on **Figure 3**, and the increases are generally contained within the apparent natural heritage system (i.e., outside of active agricultural areas). Given that this part of the watershed is within the next future urban expansion area in the Municipality and the floodplain is contained within the Tooley Creek valley corridor that will ultimately form the future Environmental Protection Area (i.e., not developable), it can be argued that the predicted slight increase in the depth and extent of flooding through this reach would have no impact on current land uses and no impact on the future development potential of the lands.

It may be possible to obtain consent from the affected landowners for the small increase in the extent of flooding on their lands. It is difficult to predict if any compensation or formal commitments would be needed to secure permission from the landowners for the small increase in flooding.

It is recommended that legal representatives from CLOCA and the Municipality review this memo and associated mapping to determine if formal consent is needed, or if the impacts are so minor that consent can be implied.

4.2.3 Main Branch Reach 3 (CPR to Baseline Road)

There is a relatively large increase in Regulatory water surface elevation (up to 0.9 m) and moderate increase floodplain extent between CPR and Baseline Road. The Baseline Road crossing is largely unaffected by the backwater from Highway 401 and appears to have an impact on flood elevation and extents with the increased flow rate in Tooley Creek. The specific flood mitigation options for this reach are as follows:

► **Option 3a – Regional control SWM facilities for all new development**

Refer to description under Option 1a.

► **Option 3b – Regional control SWM facilities in select areas of new development**

Refer to description under Option 2b.

► Option 3c – Enlarge Culvert at Baseline Road

The water surface elevations within this reach area are impacted by the Baseline Road crossing, where water levels are approximately 3 m higher than the downstream reach between Highway 401 and Baseline Road (Reach 4). Improvements at the Highway 401 crossing (discussed below) will have negligible impact on water surface elevation upstream of Baseline Road. HEC-RAS profile results are provided in **Attachment C**.

The existing culvert is a 6.34m by 2.81m concrete box culvert. Adding or enlarging the culvert by an approximate equivalent of a 1950mm diameter circular culvert would be sufficient to mitigate the flood impacts upstream of Baseline Road. **Table 4-3** summarizes the water surface elevations with and without crossing improvements. The crossing improvements may potentially be timed with future Baseline Road improvements.

Table 4-3 Summary of Water Surface Elevation with Crossing Improvement at Baseline Road

| Culvert | HEC-RAS River Station | Regulatory Water Surface Elevation, (2012 flows) (m) | Water Surface Elevation without Mitigation (updated flows) (m) | Water Surface Elevation with Mitigation (updated flows) (m) |
|------------------------------|-----------------------|--|--|---|
| Baseline Road Culvert | 1600 | 98.39 | 99.10 | 98.41 |
| | 1500 | 98.28 | 99.07 | 98.25 |
| | 1412 | 98.23 | 99.07 | 98.16 |
| | 1400 | 98.23 | 99.05 | 98.16 |

► Option 3d – Landowner consent for increase in flood levels

While increases in flood elevations of up to 0.9 m are predicted for this reach, the extent of flooding remains generally contained within the deep, steep walled valley corridor, resulting in a relatively minor increase in the extent of flooding.

This area is designated for future urban development within the Courtice Employment Lands, and the predicted increase in the extent of flooding will be contained within the Environmental Protection Area, with no loss of developable area and a potential increase in future developable area if the requirement for Regional Storm control SWM facilities was eliminated.

Given that increase in flood extent will not impact any structures, will have a negligible impact on the short-term utility of the land for agriculture and will not reduce

developable area, the solution would likely be considered acceptable to the single affected landowner. It is difficult to predict if any compensation or formal commitments would be needed to secure permission from the landowner for the small increase in flooding.

4.2.4 Main Branch Reach 4 (Baseline Road to Highway 401)

There is a relatively large increase in Regulatory water surface elevation (up to 0.6 m) and floodplain extent between Baseline Road and Highway 401. A large backwater is caused by Highway 401 and has an impact on flood elevation and extents with the increased flow rates in Tooley Creek. The Courtice Road crossing is lower in elevation than Highway 401 and does not impact the Regulatory water surface elevation. The specific flood mitigation options for this reach are as follows:

- ▶ **Option 4a – Regional control SWM facilities for all new development**
Refer to description under Option 1a.
- ▶ **Option 4b – Regional control SWM facilities in select areas of new development**
Refer to description under Option 2b.
- ▶ **Option 4c – Relief Culvert across Highway 401**

The floodplain area north of Highway 401 is influenced by the capacity of the current culvert under Highway 401 and the Courtice Road Underpass Spill. A second culvert, sized as a 2250mm diameter circular opening culvert can reduce water surface elevations upstream of Highway 401 to be below the current Regulatory water surface elevation.

Table 4-4 summarizes the water surface elevations with and without the relief culvert. Similarly, a larger Courtice Road underpass opening will also provide additional conveyance capacity, if an opportunity to widen Courtice Road is contemplated in the future.

This option will have a difficult and lengthy approvals process to implement, including approvals from the Ministry of Transportation (MTO) and a Schedule B Class Environmental Assessment (EA) for modifying the existing water crossing for the purposes of flood control. There also large cost considerations to tunnel a new culvert under Highway 401.

Table 4-4 Summary of Water Surface Elevation with Crossing Improvements at Highway 401

| Culvert | HEC-RAS River Station | Regulatory Water Surface Elevation, with CLOCA flows (m) | Water Surface Elevation without Mitigation (m) | Water Surface Elevation with Additional 2250mm Diameter Culvert (m) |
|-----------------------------------|-----------------------|--|--|---|
| Highway 401 Relief Culvert | 1270 | 95.44 | 96.01 | 95.40 |
| | 1100 | 95.42 | 95.99 | 95.36 |
| | 863 | 95.42 | 95.98 | 95.37 |
| | 784 | 95.42 | 95.98 | 95.37 |

► **Option 4d – Landowner consent for increase in flood levels**

Similar to the reach upstream of Baseline Road, despite the predicted 0.6 m in flood elevation, the extent of flooding remains generally contained within the valley corridor, resulting in a relatively minor increase in the extent of flooding.

This area is future urban development under within the Courtice Employment Lands, and the majority of the predicted increase in the extent of flooding will be contained within the Environmental Protection Area, with a potential loss of developable area that may be partially offset if the requirement for Regional Storm control SWM facilities was eliminated.

The predicted increase in flood extent will not impact any structures, but appears very close to a trailer storage area at the south-east corner of Baseline Road and Courtice Road.

It may be possible to secure permissions from affected property owners for the relatively small increases in flood extents. However, there are seven (7) different private properties affected by the increase in flooding, including three (3) small residential properties.

4.2.5 Main Branch Reach 5 (Highway 401 to Darlington Park Road)

No increases in water surface elevation are anticipated and no specific mitigation is warranted.

4.2.6 Main Branch Reach 6 (Darlington Park Road to Lake Ontario)

The increases in Regulatory water surface elevation (up to 0.1 m) and floodplain extent from Darlington Park Road to Lake Ontario are relatively minor. The specific flood mitigation options for this reach are as follows:

- ▶ **Option 6a – Regional control SWM facilities for all new development**
Refer to description under Option 1a.
- ▶ **Option 6b – Regional control SWM facilities in select areas of new development**
Refer to description under Option 2b.
- ▶ **Option 6c – Landowner consent for increase in flood levels**

Structural solutions to mitigate flooding through this reach were initially explored. However, there are no specific 'bottlenecks' in the system contributing to the very slight predicted increase in flood extents south of the CNR line.

There is one impacted private landowner within this reach, while all the other remaining properties within this reach are owned by CLOCA or MTO. Increases in Regulatory water surface elevation are relatively minor (0.1m or less) throughout the reach, and in most areas the associated increase in flood extent is imperceptible. Where there is a visible increase in flood extent, the increase is comparable to the thickness of the flood line as plotted on **Figure 3**, and the increases are fully contained within the Environmental Protection Area under the Waterfront & Energy Park Secondary Plan. It can therefore be argued that the predicted slight increase in the depth and extent of flooding through this reach would have no impact on current land uses and no impact on the future development potential of the lands.

It may be possible to obtain consent from the affected landowner for the small increase in the extent of flooding on their lands.

4.2.7 West Tributary Reach 1 (Upstream of Highway 401)

The increase in Regulatory water surface elevation (up to 0.1 m) and floodplain extent in the West Tributary upstream of Highway 401 is relatively minor. The specific flood mitigation options for this reach are as follows:

- ▶ **Option 7a – Regional control SWM facilities for all new development**

The West Tributary has two future SWM ponds north of Highway 401, according to SWS: CEL-P1 and CEL-P4. The considerations are the same as Option 1a for these proposed SWM facilities.

► **Option 7b – Open Centre Median in Highway 401 (for West Tributary Overflow)**

Flooding south of Baseline Road in the vicinity of Trulls Road is largely governed by the backwater behind the Highway 401 embankment and concrete median barrier. The predicted minor increases in flood depth upstream of Highway 401 (0.1 m or less) could be offset by removing a portion of the concrete median barrier and replacing it with an open barrier such as a steel beam guiderail. The open median barrier would allow floodwater to spill over Highway 401 at a lower elevation, effectively lowering the flood levels upstream of Highway 401. The works could also improve public safety through lower flood depths on the westbound lanes of Highway 401 during a severe storm event.

Table 4-5 below demonstrates that by removing a length of approximately 25 m of concrete median barrier and replacing it with an open barrier, upstream flood levels would be reduced below current levels, more than offsetting the small predicted increase in flow rates. Note that replacing the concrete median barrier with an open barrier over the full approximately 200 m wide overtopping flow width could significantly reduce flood levels relative to existing conditions.

Table 4-5 Summary of Water Surface Elevation with Median Barrier Improvements at Highway 401

| HEC-RAS River Station | Regulatory Water Surface Elevation, with CLOCA flows (m) | Water Surface Elevation without Mitigation (m) | Water Surface Elevation with Open Median Barrier (m) |
|-----------------------|--|--|--|
| 1046 | 94.5 | 94.6 | 94.3 |

► **Option 7c – Flood Proofing**

The only area where the predicted 0.1 m increase in flooding results in a visible increase in the extent of flooding in this reach is south of Baseline Road and east of Trulls Road. It is our understanding that plans for development of the affected parcel were approved based on the previous floodplain mapping and construction is underway.

Given the status of the affected parcel, it can be argued that no works are warranted to mitigate the small increase in flood depths. However, it is recommended that the Municipality and CLOCA work with the developer to ensure that the new development is raised above the predicted Regional Storm floodplain and protected from flooding during both current and future watershed conditions.

4.2.8 West Tributary Reach 2 (Highway 401 to Confluence)

The increase in Regulatory water surface elevation (up to 0.1 m) is relatively minor, while there is a moderate increase in floodplain extent, particularly at the two properties on Down Road. The specific flood mitigation options for this reach are as follows:

- ▶ **Option 8a – Regional control SWM facilities for all new development**

The West Tributary has two future SWM ponds north of Highway 401, according to SWS: CEL-P1 and CEL-P4. The considerations are the same as Option 1a for these proposed SWM facilities.

- ▶ **Option 8b – Landowner consent for increase in flood levels**

Structural solutions to mitigate flooding through this reach were initially explored. However, there are no specific 'bottlenecks' in the system contributing to the very slight (up to 0.2 m) predicted increase in flood extents south of Highway 401.

There are two (2) impacted properties within this reach, both of which fall under the Waterfront & Energy Park Secondary Plan. The predicted extent of flooding under both current and future land use conditions appears to extend beyond the Environmental Protection Area as shown in the Secondary Plan. Active agricultural activities appear to take place to the edge of the narrow channel corridor.

It may be possible to obtain consent from the affected landowners for the small increase in the extent of flooding on their lands.

5 EVALUATION OF MITIGATION OPTIONS

5.1 Evaluation Criteria

The flood mitigation options described in Section 4 were comparatively and qualitatively evaluated based on criteria developed within the following categories:

- ▶ **Technical feasibility**, which relates to the effectiveness, constructability, operation and maintenance, and other engineering aspects of the options.
- ▶ **Impacts/benefits to environmental resources**, which relates to potential impacts and benefits to the natural and physical components of the environment, including environmental sensitive areas, recognizing that broad generalizations were made, given that environmental resources were not characterized through this study.
- ▶ **Cost effectiveness**, which relates to the capital and maintenance costs of the options. Considerations for the potential impact to future developable area were also included.
- ▶ **Timing**, which relates to implementation timing, which considers the timing of future development and approval processes.

5.2 Evaluation

The comparative and qualitative evaluation are outlined in the matrix below (**Table 5-1**), including a recommendation for each flood mitigation option. For many reaches of Tooley Creek, the small increases in flood extents (less than 0.2 m) will be fully contained within the extent of the natural features associated with the valley that form the Environmental Protection Areas depicted on current and future Secondary Plans, and permission from these affected landowners for the floodplain increases would be practical.

The exception is the area between Baseline Road to Highway 401 (Main Branch Reach 4). There are seven (7) private properties within this reach impacted by the flood level increase, including three (3) residential properties. The flood extents appear to be beyond the limit of natural features associated with the Tooley Creek Valley, and thus would become the governing constraint for future development on these properties. The relatively large magnitude of increase in the water surface elevation and flood extents would also severely limit the likelihood of obtaining landowner permissions for the increase.

The options for Main Branch Reach 4 become limited to either providing quantity control in upstream developments to reduce peak flow rates in Tooley Creek (Options 4a or 4b) or increasing the conveyance capacity at Highway 401 (Option 4c). To elaborate on the evaluation

of these options, Option 4c provides a relief culvert at Highway 401 to mitigate flood floods and potentially reduce the Regulatory floodplain from its current extent, provided that there is a suitable alignment to tunnel an opening of the required size. However, the capital costs will be very high and the approvals process with MTO and the required Class EA would be onerous.

The option to provide Regional Storm controls for new development (Option 4a) will also effectively mitigate flooding for all reaches downstream of these controlled discharges. The SWS recommended twelve (12) Regional Storm control SWM facilities within the Tooley Creek watershed, which would need to be operated and maintained by the Municipality in the long-term. There is also a reduction in developable area due to the larger SWM facility footprints for larger storage volumes.

With that, Option 4b was considered to reduce the number of Regional Storm control SWM facilities in the new development areas. Typically, runoff timing effects within a watershed will allow downstream catchment areas to discharge without quantity controls, while upstream areas are controlled, to stagger peak flows within the main branch of a watercourse.

From the land use plans, the downstream development areas consist of the Courtice Employment Lands, thus Option 4b considers uncontrolled flows for these lands, while the upstream Southeast Courtice Secondary Plan area will have Regional Storm controls. Furthermore, employment lands (industrial development) are generally less conducive to publicly owned SWM facilities (required for Regional storm control) because of fewer public roads, large properties, and more disintegrated development phasing.

Therefore, the overall recommendation for Tooley Creek flood mitigation is as follows:

- ▶ **Option 2b – Regional control SWM facilities in select areas of new development (namely, the Southeast Courtice Secondary Plan Area)**
- ▶ **Option 6c and 8b - Landowner consent for minor increase in flood levels**

This option is required because Option 2b is not expected to provide adequate flood mitigation for the West Tributary of Tooley Creek and areas downstream of Highway 401.

- ▶ **Option 7c – Flood Proofing**

This option is required because Option 2b is not expected to provide adequate flood mitigation the West Tributary of Tooley Creek upstream of Highway 401.

Table 5-1 Evaluation Matrix

| Option | Technical Feasibility | Impact / Benefits to Environmental Resources | Cost Effectiveness | Timing | Recommendation |
|---|--|--|--|---|--|
| 1a, 2a, 3a, 4a, 5a, 7a, and 8a – Regional control SWM facilities for all new development | Will effectively mitigate the increase in peak flow rates across all Tooley Creek reaches, and negates the need for other mitigation options. Long-term maintenance required at twelve (12) SWM facilities. | Neither negative impact nor benefit to environmental resources. | Developers to fund initial capital costs. For the MOC, relatively high long-term operating and replacement costs for twelve (12) SWM facilities. Loss of developable area relative to no Regional controls. | To be implemented as each development area is constructed. | Not Recommended |
| 1b, 2c, 3d, 4d, 6c, 8b – Landowner consent for minor increase in flood levels | No mitigation provided to downstream reaches. For Option 8b, Channel reconstruction within the Waterfront & Energy Park Secondary Plan will provide full flood mitigation. | Neither negative impact nor benefit to environmental resources. For Option 8b, channel reconstruction within the Waterfront & Energy Park Secondary Plan will require removal of vegetation within the existing watercourse valley that will be restored post-construction. | No capital costs associated with this option. No impact or minor impact to developable area. | Landowner permissions would need to be obtained in the short term to confirm that this option is viable, prior to upstream development occurring. | Recommended for Main Branch Reach 6 and West Tributary Reach 2 (Option 6c and 8b), in combination with 2b, 3b, 4b, 6b – Regional control SWM facilities in select areas of new development. |
| 2b, 3b, 4b, 6b – Regional control SWM facilities in select areas of new development | Will effectively mitigate the increase in peak flow rates for Main Branch Reach 4 (the reach with greatest increase in flood elevation and extents). Long-term maintenance required at eight (8) SWM facilities. | Neither negative impact nor benefit to environmental resources. | Developers to fund initial capital costs. For the MOC, relatively high long-term operating and replacement costs for eight (8) SWM facilities. Loss of developable area relative to no Regional controls for Southeast Courtice Secondary Plan area. | To be implemented as each development area is constructed. | Recommended |
| 3c – Enlarge Culvert at Baseline Road | Will effectively mitigate the increase in peak flow rates within Main Branch Reach 3. | Neither negative impact nor benefit to environmental resources. | Moderately high initial capital costs, which can be lessened if constructed in conjunction with road improvements. No impact or minor impact to developable area. | To be implemented prior to proposed upstream development occurring and/or in conjunction with road improvements. | Not Recommended |
| 4c – Relief Culvert across Highway 401 | Will effectively mitigate the increase in peak flow rates within Main Branch Reach 4. Difficult approvals process involving MTO and a Class EA. | Neither negative impact nor benefit to environmental resources. | Relatively high capital costs. Potentially improves developable area for affected properties. | To be implemented prior to proposed upstream development occurring. | Not Recommended due to the high cost and difficulty of obtaining approvals. |
| 7b – Open Centre Median in Highway 401 (for West Tributary Overflow) | Approvals from MTO are required. | Neither negative impact nor benefit to environmental resources. | Moderately higher capital costs. Potentially improves developable area for affected properties. | To be implemented prior to proposed upstream development occurring. | Not Recommended |
| 7c – Flood Proofing | Will be effective flood mitigation for individual properties implementing flood proofing measures. | Neither negative impact nor benefit to environmental resources. | Developer to fund capital costs and maintain any floodproofing measures. No impact or minor impact to developable area. | To be implemented as sites are developed. | Recommended |

6 ADDITIONAL MODELLING ANALYSIS OF THE RECOMMENDED FLOOD MITIGATION OPTION

6.1 Overview

The recommendations for Tooley Creek flood mitigation summarized in **Section 5.2** included Regional control SWM facilities in select areas of new development. The initial analysis for this option was a cursory review of the SWS hydrologic model which indicated that peak flow rates in Tooley Creek for the Main Branch Reaches 1 to 4 would be sufficiently mitigated, including the area upstream of Highway 401 with the greatest flood elevation increase in future conditions (**Section 4.2.2**).

To provide guidance on Regional control criteria for future development within the Tooley Creek watershed, additional modelling was completed to determine target release rates. In addition, based on discussions with CLOCA, future development within the watershed will also include large portions of the watershed that are outside of the current MOC Official Plan, but were recently added to the Region of Durham's new Official Plan adopted by Regional Council in May 2023. Map 1 of the Regional Official Plan designates the additional lands as part of the '2051 urban expansion area', which was not previously considered during the SWS.

Thus, the hydrologic model updated for this study (**Section 2**) was further refined to include the future land uses within the 2051 urban expansion area and proposed Regional control to confirm that the recommended flood mitigation strategy will be effective for mitigating peak flow rates increases in Tooley Creek.

In general, the additional modelling analysis demonstrated that the 2051 urban expansion area impacts downstream peak flow rates such that all future development in the 2051 urban expansion area will also be required to provide Regional flood control. For future development areas within the current MOC Official Plan, the previous recommendation (**Section 5.2**) was also confirmed to be required: future residential areas (i.e., the Southeast Courtice Secondary Plan area) shall have Regional flood control, while future employment lands within the MOC Official will not have Regional flood control. Results of the modelling analysis and recommendations for the implementation of the mitigation strategy are provided in the following sections.

6.2 Additional Modelling Analysis

The additional modelling analysis builds upon the Tooley Creek hydrologic model update described in **Section 2**, which was based on CLOCA's 2012 VO model. Future conditions land

use was further updated according to Durham's new Regional Official Plan Map 1 for the 2051 urban expansion area, which consisted of employment lands and residential lands beyond the current MOC Official Plan that was used for the SWS (**Figure 5 and 6**). GIS data from Durham Region was used to confirm the extents of the urban expansion area within the Tooley Creek watershed.

With the objective of introducing quantity controls into the VO model, the Tooley Creek catchment areas upstream of Highway 401 were divided based on the future development land use from the MOC Secondary Plans and Official Plan, and the Regional Official Plan's 2051 urban expansion area, such that residential, industrial/commercial, and utility (highway) corridors were divided to model the flood mitigation strategy.

Six (6) route reservoirs were added to the model for all future residential areas and for the 2051 urban expansion area to determine allowable release rates for Regional control. A single unit release rate for the Regional storm was applied at each of route reservoirs. The unit release rate was iterated in the model until the peak flow rates within the Tooley Creek, upstream of Highway 401, matched the peak flow rates from the CLOCA's 2012 future conditions hydrologic model that produced CLOCA's current Regulatory peak flow rates. A minor exception is noted at Flow Node 1 for the upstream-most catchment area of Tooley Creek due to the difficulty with matching CLOCA's 2012 future conditions peak flow rates with Regional control applied to only the future residential development upstream of Flow Node 1. However, the minor (or potentially negligible impact) to the floodplain in the area of Flow Node 1 is expected to be acceptable for landowners in lieu of a larger Regional control SWM facility for future development in that area.

While the Regulatory floodline is determined from the greater of the 100-year storm or Regional Storm floodlines, this only applies to uncontrolled catchment areas. For areas with flood control facilities, the Regional Storm produces higher peak flow rates due to larger runoff volumes routed through the storage facilities. Therefore, only the Regional Storm was modelled to verify the effectiveness of the flood mitigation strategy.

Furthermore, based on the SWS's quantity control criteria, each development area is also required to match pre-development peak flow rates up to the 100-year storm event, which would be more restrictive than the 100-year peak flow rates under CLOCA's 2012 Regulatory hydrologic model (which considered uncontrolled future development areas). Within the VO model, the route reservoir rating curves did not consider 2-year to 100-year control release rates and storage volumes. Instead, the rating curves consisted of one discharge-storage point representing the Regional Storm allowable release rate. Thus, the Regional storage volume determined through this model is not representative of the total required storage for SWM facilities at these development areas. The unit release rate is the flood control criteria that would need to be considered during the design of these SWM facilities (see **Section 6.3** for more

discussion on implementation).

A model scenario for the updated land use was also created without any quantity controls. The results indicated that downstream peak flow rates in the 100-year and Regional Storm events were well above CLOCA's current Regulatory peak flow rates (2012 future conditions modelling) (**Table 6-1**). For the flood control SWM facilities, a Regional Storm unit release rate of 0.098 m³/s/ha was required to mitigate peak flow rates in Tooley Creek Main Branch upstream of Highway 401 (**Table 6-2**). The preliminary Regulatory floodline is presented on **Figure 7** for the 2051 urban expansion with flood control.

Table 6-1 Tooley Creek Uncontrolled Peak Flow Rates with 2051 Urban Expansion

| Tooley Creek Reach | Flow Node | 2012 CLOCA Future Conditions Peak Flow Rate (m ³ /s) | | 2023 TYLin Future Conditions Update Uncontrolled Peak Flow Rate with 2051 Urban Expansion (m ³ /s) | |
|---|------------------------|---|----------|---|------------------|
| | | 100-year | Regional | 100-year | Regional |
| Upstream of West Tributary HEC-RAS Reach: Tooley_Upper | 1 | 4.24 | 12.41 | 23.24 | 16.82 |
| | 1 + 69% of Flow Node 2 | 9.18 | 20.48 | n.a. (Note 1) | n.a. (Note 1) |
| | 3 | 9.23 | 22.09 | 33.48 | 28.71 |
| | 3 + 23% of Flow Node 6 | 12.01 | 31.15 | n.a. (Note 1) | n.a. (Note 1) |
| | 3 + 62% of Flow Node 6 | 20.23 | 46.51 | n.a. (Note 1) | n.a. (Note 1) |
| | 3 + 92% of Flow Node 6 | 26.55 | 58.33 | n.a. (Note 1) | n.a. (Note 1) |
| | 7 | 27.48 | 59.94 | 91.53 | 74.46 |
| | 17 | 35.03 | 74.24 | 99.07 | 91.74 |
| | 18 | 35.18 | 74.77 | 106.61 | 92.39 |
| | 19 | 43.09 | 91.51 | 123.00 | 113.45 |
| | 20 | 48.87 | 99.84 | 127.56 | 122.38 |
| | 24 | 48.87 | 99.88 | 129.57 | 122.44 |
| Downstream of West Tributary HEC-RAS Reach: Tooley_Lower | 29 | 65.08 | 118.12 | 158.69 | 142.81 |
| | 35 | 64.74 | 127.67 | 146.12 | 151.55 |
| West Tributary HEC-RAS Reach: Tooley_West | 25 | 13.82 | 17.64 | 39.26 | 18.14 |
| | 27 | 16.67 | 20.80 | 35.85 | 21.46 |

1. Catchment areas in the 2051 urban expansion area model scenario were re-delineated for the flood mitigation strategy and did not match the 2012 CLOCA modelled catchment areas at this flow node, therefore, results were not calculated.

Table 6-2 Tooley Creek Peak Flow Rates with 2051 Urban Expansion and Flood Control

| Tooley Creek Reach | Flow Node | 2012 CLOCA Future Conditions Peak Flow Rate (m ³ /s) | | 2023 TYLin Future Conditions Update Peak Flow Rate with 2051 Urban Expansion and Flood Control (m ³ /s) | | Regulatory Peak Flow Rate (m ³ /s) |

| | 27 | 16.67 | 20.80 | 35.71 | 21.46 | 35.71 (Note 4) |

1. The 2051 urban expansion model scenario for flood mitigation does not provide accurate 100-year peak flow rates due to the rating curves used at the route reservoir storages (as described in the above text).
2. Catchment areas in the 2051 urban expansion area model scenario were re-delineated for the flood mitigation strategy and did not match the 2012 CLOCA modelled catchment areas at this flow node. However, the unit discharge (m³/s/ha) in the 2023 flood control model scenario was confirmed to be below the 2012 CLOCA future conditions unit discharge.
3. Refer to Section 6.2 for discussion on the slight increase in Regulatory flow rate at Node 1 above the 2012 CLOCA Regulatory flow rate.
4. Regulatory flow rate increases in the West Tributary shall be mitigated according to Options 6c and 8b (refer to Section 5.2 for discussion).

6.3 Implementation of Regional Control SWM Facility

Mitigation Option

The Regional Storm target release rate would apply to new development areas within the watershed specified through the recommended flood mitigation strategy (**Table 6-3**). Stormwater management facilities in these areas will provide quantity control for the 2-year to 100-year storm events as well as control for the Regional Storm.

The storage volume requirements for Regional Storm control would be determined for each individual SWM facility based on the design specifications to meet all quantity control criteria (match pre-development peak flow rates up to the 100-year storm and Regional storm control).

Table 6-3 Summary of Regional Storm Control Release Rates

| Subwatershed | Development Area | Regional Storm Control Unit Release Rate |
|----------------|--|--|
| Tooley Creek | Southeast Courtice Secondary Plan | 0.098 m ³ /s/ha |
| | 2051 Urban Expansion Area | 0.098 m ³ /s/ha |
| | All areas outside of the above development areas | No Regional Storm Control |
| Robinson Creek | All areas | No Regional Storm Control |

A future SWS update(s) to consider the 2051 urban expansion area in upcoming secondary plans shall also include analysis for Regional release rate targets to verify the flood mitigation strategy.

In addition, Regulatory floodplain mapping with the recommended flood mitigation strategy will be updated after this study is finalized.

7 CLOSING

We trust that the analysis and findings summarized herein meets the needs of CLOCA and the Municipality at this time.

Please contact the undersigned should you have any questions.

Sincerely,

T.Y. LIN INTERNATIONAL CANADA INC.
